

Amendments to the Claims:

- 1 1. **(Currently amended)** A method for detecting a quantitative measure of a
2 pathophysiologic state of a human myocardium or coronary artery of an individual,
3 the method comprising:
- 4 a) attaching at least one electrode pair to the myocardium;
- 5 b) recording baseline measurements of the mean myocardial electrical impedance
6 and computing the variance of the myocardial electrical impedance between each
7 electrode pair;
- 8 c) computing a baseline value of mean myocardial electrical impedance from the
9 baseline measurements;
- 10 d) periodically measuring mean myocardial electrical impedance values between
11 each electrode pair over an interval of time and storing data representing the
12 impedance values as a function of time; and
- 13 e) after the mean myocardial electrical impedance changes from the computed
14 baseline value by at least the measured variance, diagnosing the extent of change
15 in the myocardial pathophysiologic state as a continuous, smooth, function of the
16 extent of change, or rate of change, of the periodically measured myocardial
17 electrical impedance from the baseline value.

1 2. **(Original)** A method in accordance with claim 1 wherein:
2 a) the pathophysiologic state is the ischemia of a portion of the myocardium; and
3 b) after the mean myocardial electrical impedance between the electrode pairs rises
4 above a value equal to the arithmetic sum of the baseline myocardial electrical
5 impedance and the variance, myocardial ischemia severity is diagnosed as a
6 continuous, smooth, increasing function of the extent of the rise of the mean
7 myocardial electrical impedance above the baseline value.

1 3. **(Withdrawn)** A method in accordance with claim 1 wherein:
2 a) the pathophysiologic state is the extent of stenosis pre-existing in a coronary
3 artery;
4 b) each electrode pair is attached to the myocardium in the region of the
5 myocardium perfused by the coronary artery;
6 c) the coronary artery is occluded proximally after recording the baseline
7 measurements; and
8 d) after the mean myocardial electrical impedance between the electrode pair rises
9 above a value equal to the arithmetic sum of the baseline myocardial electrical
10 impedance and the variance, the extent of stenosis pre-existing in the coronary
11 artery is diagnosed as a continuous, smooth, decreasing function of the extent of
12 rise of the mean myocardial electrical impedance above the baseline value.

1 4. **(Withdrawn)** A method in accordance with Claim 3 wherein the continuous, smooth,
2 decreasing function is substantially:

3
$$\%stenosis = -2.89 \times \%MEI + 410.044,$$

4 wherein

5 $\%stenosis$ is the percent pre-existing blockage in the coronary artery and

6 $\%MEI$ is the increase of the mean myocardial electrical impedance above the
7 baseline value expressed as a percent.

1 5. **(Withdrawn)** A method in accordance with claim 1 wherein:

2 a) the state is the reperfusion of a portion of the myocardium; and

3 b) after the mean myocardial electrical impedance between the electrode pairs

4 declines below a value equal to the arithmetic difference of the baseline

5 myocardial electrical impedance and the variance, the myocardial reperfusion

6 level is diagnosed as a continuous, smooth increasing function of the extent of the

7 decline of the mean myocardial electrical impedance below the baseline value.

1 6. **(Withdrawn)** A method in accordance with Claim 5 whereby the efficacy and level of
2 success of coronary artery bypass surgery is diagnosed as the extent of reperfusion.

- 1 7. **(Withdrawn)** A method in accordance with claim 1 wherein:
- 2 a) the pathophysiologic state is myocardial tissue rejection following heart
- 3 transplantation; and
- 4 b) after the mean myocardial electrical impedance between the electrode pair rises
- 5 above a value equal to the arithmetic sum of the baseline myocardial electrical
- 6 impedance and the variance, the myocardial tissue rejection severity is stratified
- 7 as a continuous, smooth, increasing function of the rise of the myocardial
- 8 electrical impedance above the baseline value.
- 1 8. **(Withdrawn)** A method in accordance with claim 1 wherein:
- 2 a) the state is the effectiveness of cardioplegia of the myocardium during on-pump
- 3 coronary artery bypass graft surgery;
- 4 b) the method further comprises, after recording the baseline measurements, placing
- 5 the myocardium on bypass and applying a selected type of cardioplegia;
- 6 c) after the mean myocardial electrical impedance between the electrode pairs rises
- 7 above a value equal to the arithmetic sum of the baseline myocardial electrical
- 8 impedance and the variance, the effectiveness of the cardioplegia is diagnosed as
- 9 an inverse, continuous, smooth, increasing function of the rise of the myocardial
- 10 electrical impedance rises above the baseline value.

- 1 9. **(Withdrawn)** A method in accordance with claim 1 wherein:
- 2 a) the state is the effectiveness of ischemia preconditioning of the myocardium
- 3 during coronary artery bypass graft surgery;
- 4 b) the baseline measurements are recorded immediately prior to placing the heart on
- 5 bypass;
- 6 c) the method further comprises, after preconditioning and the beginning of the
- 7 ischemic period of surgery, calculating the rate of rise (ohms/minute) of the
- 8 myocardial electrical impedance; and
- 9 d) the diagnosing step more particularly comprises diagnosing the effectiveness of
- 10 the ischemia preconditioning as an inverse, continuous, smooth, increasing
- 11 function of the extent of the rate of rise of the myocardial electrical impedance.
